

## Introduction to Matlab

Matlab (MATrix LABoratory) will be the programming environment of choice for the numerical solutions developed in this textbook due to its wide availability and its ease of use. Matlab provides an interactive screen where commands can be typed and where the software returns output from those commands. The figure below shows the Matlab interactive environment for an earlier Student Edition of the software.

The cursor is shown in this figure in front of the Matlab prompt, in this case, `EDU>>`. One can type commands in front of the prompt and then press the `<Enter>` key to activate the command and obtain an output from Matlab. For example, Matlab can be used as a calculator to obtain the value of the following expression

$$\frac{2 + \frac{3}{4}}{\sqrt{12.5}}$$

by typing the following statement at the prompt: `(2+3/4)/sqrt(12.5)`

Matlab replies with the following output:

```
ans =  
    0.7778
```

This results indicates that Matlab calculated the numerical result of the expression typed and stored that value in a *variable* named `ans` (answer). Matlab then showed the contents of variable `ans` in the interactive window.

Please notice that Matlab will replace the contents of variable `ans` with the most recent result everytime that a calculation is performed in the Matlab window. To verify this statement, try the following calculations in Matlab (remember to press <Enter> after each entry):

```
(5+3/4)^2.3/sqrt(5+1/3)
```

```
sin(2*pi/3)
```

```
log(2.3+sqrt(4.2))
```

These examples illustrate a few interesting facts about Matlab:

1. The fundamental arithmetic operation symbols are +, -, \*, and /
2. To raise a number or expression to a power use the caret symbol ^
3. The ratio of the length of a circle to its diameter, typically referred to as  $\pi$ , is available by typing `pi`.
4. Many classical mathematical functions such as the trigonometric functions sine (`sin`), cosine (`cos`), tangent (`tan`), and the natural logarithm (`log`) and exponential (`exp`) functions are available for calculations.

A few other important issues about using Matlab are listed next:

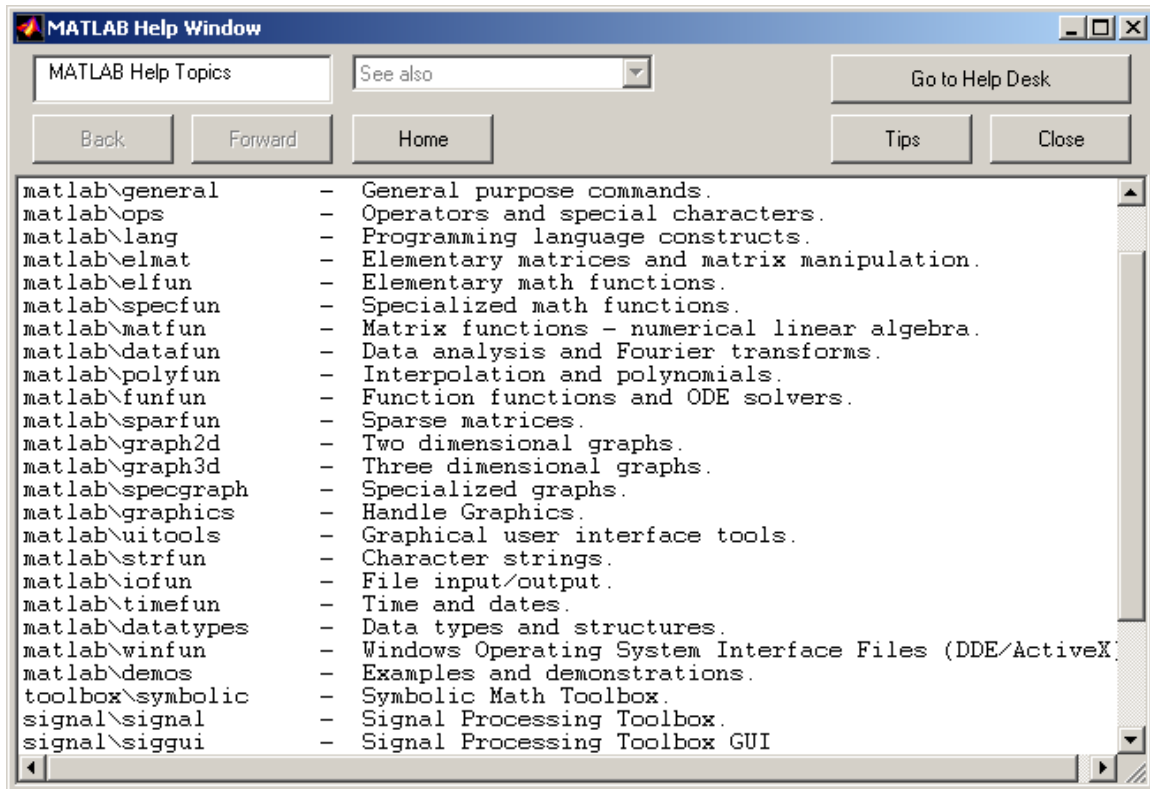

1. The *Edit* menu includes the options *Undo*, *Copy*, *Cut*, and *Paste* for editing expressions in the Matlab window. In *Windows*-based systems, you can also use *Cntl-C* and *Cntl-V* to copy and paste.
2. If you have to type a very long expression that requires two or more lines in the Matlab window, you can use the continuation characters (`. . .`) to specify the command, for example:

```
EDU>> (2.5+3.5*pi+1/log(2.3+sqrt(1.2)))/ ...  
       (2.3+sin(3*pi/7)-1/2)
```

```
ans =
```

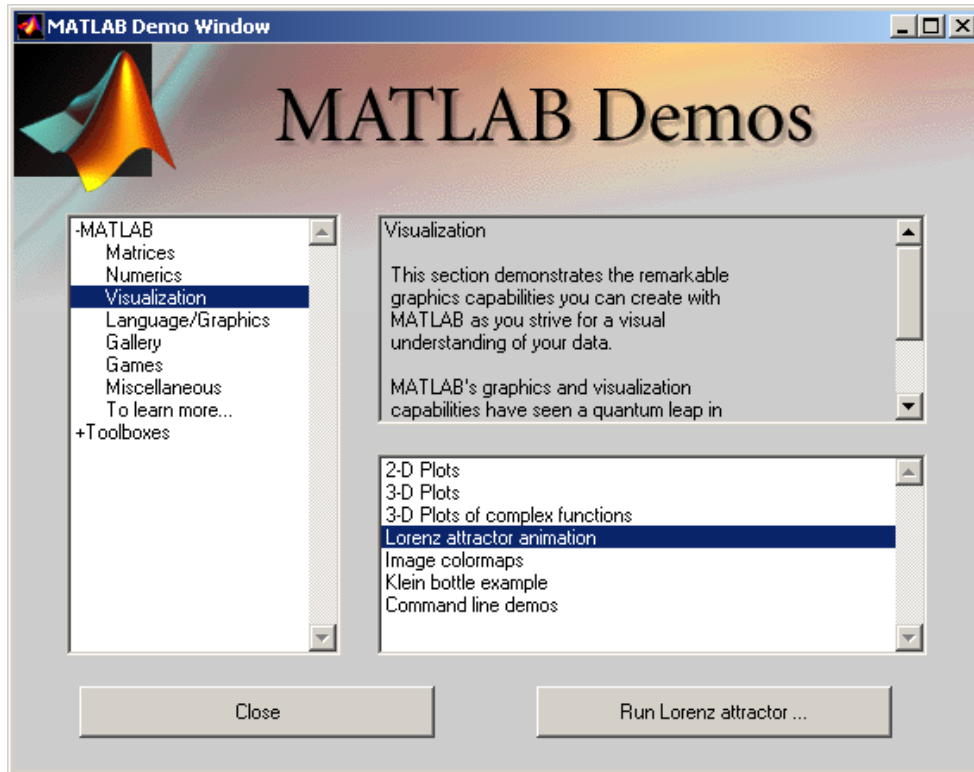

```
5.1582
```

3. The *Help* menu contains several options for finding information about Matlab functions or commands. The option *Help Tips* provides information on the use of the *Help* facility. The option *Help window* produces a text window listing various chapters of help entries grouped according to certain subjects (see figure below). Double-click on any of the chapters to access a listing of functions contained in that chapter. Double click on any of the functions listed to get a help entry on that function. For example, find the help entry for function `plot3` in the help chapter entitled *Matlab\graph3d*.

The option *Examples and Demos* in the *Help* menu activates a Matlab dialog box showing a number of applications of Matlab in various fields of mathematics (see first figure below). Click on the titles shown in the left frame of the dialog box to select a specific collection of examples. Click on a specific application title in the field at the bottom of the dialog box to select that particular example. Press the *Run* button to activate the demonstration. Typically, there will be a new dialog box open with an output figure and a field listing the Matlab commands needed to produce the given result.

The option *Help Desk(HTML)* in the *Help* menu activates an *html* document (a web page) that contains information about the operation of Matlab (see figure below). Click on the link *Documentation Roadmap* to get an overall view of the *Help Desk* contents. Click on the link *Getting Started* to get an overview of Matlab's operation for mathematical calculations and graphics. The frame to the left in the *Getting Started* web page provides an outline of the page contents. Dedicate some time to explore the different chapters thus contained. These chapters and subchapters contain definitions and examples to help you learn the use of Matlab.

### Using the *Help Desk* to learn about the Matlab environment

This sections offer guidelines on using the *Help Desk* to learn the basics about the Matlab environment.

Open the *Help Desk* web page as described above. Click on the link *Matlab Environment* and follow the outline of the page contents shown in the left-hand field. Click on the links in the contents field to see examples and exercises for any particular section.

It is recommended that you read the contents of the *Matlab Environment* web page while running Matlab so you can reproduce the exercises shown in the *Help Desk*. To facilitate trying the exercises in your own Matlab window, simply copy the commands listed in the *Help Desk* and paste them in your command window.

Read the *Matlab Environment* web page in detail to learn the basic operation of the Command Window, the Editor, and the Figure windows (used to produce graphics).

### Using the *Help Desk* to learn Matlab operation

This sections offer guidelines on using the *Help Desk* to learn the use of Matlab on your own.

Open the *Help Desk* web page as described earlier. Click on the link *Getting Started* and follow the outline of the page contents shown in the left-hand field. Click on the links in the contents field to see examples and exercises for any particular section.

It is recommended that you read the contents of the *Getting Started* web page while running Matlab so you can reproduce the exercises shown in the *Help Desk*. To facilitate trying the exercises in your own Matlab window, simply copy the commands listed in the *Help Desk* and paste them in your command window.

Since the *Getting Started* page contains a large variety of concepts and examples, it is recommended that you take a few days to go over all of them while trying the corresponding exercises. The following schedule of reading is recommended based on the amount of material and on the contents of the outline. You may want to keep a notebook handy to summarize the most important commands you learn while reading the *Help Desk* pages.

#### Day 1 – Introduction

##### **Introduction**

- What Is MATLAB?
- The MATLAB System
- About Simulink

##### **Getting Started**

- Starting MATLAB
- Matrices and Magic Squares
  - Entering Matrices
  - sum, transpose, and diag

- Subscripts
- The Colon Operator
- The magic Function
- Expressions
  - Variables
  - Numbers
  - Operators
  - Functions
  - Expressions
- Working with Matrices
  - Generating Matrices
  - load
  - M-Files
  - Concatenation
  - Deleting Rows and Columns

## Day 2 - Command window/graphics

### **The Command Window**

- The format Command
- Suppressing Output
- Long Command Lines
- Command Line Editing

### **Graphics**

- Creating a Plot
- Figure Windows
- Adding Plots to an Existing Graph
- Subplots
- Imaginary and Complex Data
- Controlling Axes
- Axis Labels and Titles
- Mesh and Surface Plots
- Visualizing Functions of Two Variables
- Images
- Printing Graphics

## Day 3 - Help / Matlab environment

### **Help and Online Documentation**

- The help Command
- The Help Window
- The lookfor Command
- The Help Desk
- The doc Command
- Printing Online Reference Pages
- Link to the MathWorks

## **The MATLAB Environment**

- The Workspace
- save Commands
- The Search Path
- Disk File Manipulation
- The diary Command
- Running External Programs

## Day 4 - Matrices / Arrays

### **More About Matrices and Arrays**

- Linear Algebra
- Arrays
- Multivariate Data
- Scalar Expansion
- Logical Subscripting
- The find Function

## Day 5 - Flow control

### **Flow Control**

- if
- switch and case
- for
- while
- break

## Day 6 - Data/Scripts/Functions

### **Other Data Structures**

- Multidimensional Arrays
- Cell Arrays
- Characters and Text
- Structures

### **Scripts and Functions**

- Scripts
- Functions
- Global Variables
- Command/Function Duality
- The eval Function
- Vectorization
- Preallocation
- Function Functions

## Day 7 - Handle graphics

### **Handle Graphics**

- Graphics Objects
- Graphics Objects

- Object Handles
- Object Creation Functions
- Object Properties
- set and get
- Graphics User Interfaces
- Animations
- Movies

## **Learning More**

### **Using the *Help Desk* to learn about Matlab graphics**

This sections offer guidelines on using the *Help Desk* to learn the use of Matlab graphics on your own. While some examples of graphics were presented in the contents of the *Getting Started* page, more detailed exampls on graphics are presented in the page entitled *Using Matlab graphics*.

Open the *Help Desk* web page as described in an earlier page. Click on the link *Using Matlab Graphics* and follow the outline of the page contents shown in the left-hand field. Click on the links in the contents field to see examples and exercises for any particular section.

The following schedule of reading is recommended based on the amount of material and on the contents of the outline.

### Day 1 – Introduction

#### **Introduction**

- High-Level Graphics
- Handle Graphics
- Building Interactive GUIs
- How It All Fits Together
- Where to Begin

#### **Basic Plotting**

- Basic Plotting Commands
- Creating Plots
- Specifying Line Style
- Specifying the Color and Size of Lines
- Adding Plots to an Existing Graph
- Plotting Only the Data Points
- Plotting Markers and Lines
- Line Styles for Black and White Output
- Setting Default Line Styles

### Day 2 – Line plots / Figure windows

#### **Line Plots of Matrix Data**

- Plotting Imaginary and Complex Data
- Plotting with Two Y-Axes

- Line Plots of 3-D Data
- Setting Axis Parameters
  - Axis Limits and Ticks
  - Example - Specifying Ticks and Tick Labels
  - Setting Aspect Ratio
- Figure Windows**
  - Displaying Multiple Plots per Figure
  - Specifying the Target Axes
  - Default Color Scheme

### Day 3 - Labeling graphs

#### **Labeling Graphs**

- Labeling Individual Axes
- Adding Text Strings to a Graph
- Positioning Text on Graphs
- Text Alignment
- Specifying TeX Characters
- Using Variables in Text Strings
- Example - Aligning Text
- Example - Multiline Text

### Day 4 - Specialized graphs

#### **Specialized Graphs**

- Bar and Area Graphs
  - Types of Bar Graphs
  - Stacked Bar Graphs to Show Contributing Amounts
  - Specifying X-Axis Data
  - Overlaying Plots on Bar Graphs
- Area Graphs
  - Comparing Datasets with Area Graphs
- Pie Charts
  - Removing a Piece from a Pie Charts
- Histograms
  - Histograms in Cartesian Coordinate Systems
  - Histograms in Polar Coordinate Systems
  - Specifying Number of Bins

### Day 5 - Discrete / velocity data graphs

#### **Discrete Data Graphs**

- Two-Dimensional Stem Plots
- Combining Stem Plots with Line Plots
- Three-Dimensional Stem Plots
- Stairstep Plots

#### **Direction and Velocity Vector Graphs**

- Compass Plots
- Feather Plots
- Two-Dimensional Quiver Plots
- Three-Dimensional Quiver Plots

#### Day 6 - Contour / interactive plots

##### **Contour Plots**

- Creating Simple Contour Plots
- Labeling Contours
- Filled Contours
- Drawing a Single Contour Line at a Desired Level
- The Contouring Algorithm
- Changing the Offset of a Contour
- Displaying Contours in Polar Coordinates

##### **Interactive Plotting**

- Animation
  - Movies
  - Erase Modes

#### Day 7 - Three dimensional graphs

##### **Creating 3-D Graphs**

- Representing a Matrix as a Surface
  - Mesh and Surface Plots
  - Visualizing Functions of Two Variables
  - Surface Plots of Nonuniformly Sampled Data
  - Parametric Surfaces
  - Hidden Line Removal
- Coloring Mesh and Surface Plots
  - Colormaps
    - Indexed Colors - Direct and Scaled Colormapping
    - Example - Mapping Surface Curvature to Color
  - Altering Colormaps
- Truecolor
- Texture Mapping

#### Day 8 - Defining the view

##### **Defining the View**

- Setting the Viewpoint
- Defining Scenes with Camera Graphics
  - Camera Graphics Commands
  - Example - Dollying the Camera
  - Example - Creating a Fly-Through
- Low-Level Camera Properties

- Default Viewpoint Selection
- Moving In and Out on the Scene
- Making the Scene Larger or Smaller
- Revolving Around the Scene
- Rotation without Resizing of Graphics Objects
- Rotation About the Viewing Axis
- View Projection Types
  - Projection Types and Camera Location

#### Day 9 - Axes aspect ratio

##### **Understanding Axes Aspect Ratio**

- Specifying Axis Scaling
- Specifying Aspect Ratio
- Example - axis Command Options
- Additional Commands for Setting Aspect Ratio

##### **Low-Level Aspect Ratio Properties**

- Default Aspect Ratio Selection
- Overriding Stretch-to-Fill
- Effects of Setting Aspect Ratio Properties
- Example - Displaying Real Objects

#### Day 10 - Lighting

##### **Lighting as a Visualization Tool**

- Lighting Commands
- Light Objects
- Adding Lights to a Scene
- Properties that Affect Lighting
- Selecting a Lighting Method
- Reflectance Characteristics of Graphics Objects
  - Specular and Diffuse Reflection
  - Ambient Light
  - Specular Exponent
  - Specular Color Reflectance
  - Back Face Lighting
  - Positioning Lights in Data Space

#### Day 11 - Volume visualization

##### **Volume Visualization Techniques**

- Volume Visualization Commands
- Visualizing Scalar Volume Data
- Example - Visualizing MRI Data
- Exploring Volumes with Slice Planes
  - Example - Slicing Fluid Flow Data
- Modifying the Color Mapping

- Connecting Equal Values with Isosurfaces
- Isocaps Add Context to Visualizations
  - Defining Isocaps
- Visualizing Vector Volume Data
  - Stream Line Plots of Vector Data
  - Vector Data Displayed with Cone Plots

#### Day 12 – Patches in 3D

##### **Creating 3-D Models with Patches**

- Behavior of the patch Function
- Creating a Single Polygon
- Multi-Faceted Patches
  - Example - Defining a Cube
- Specifying Patch Coloring
- Face and Edge Coloring
  - Example - Specifying Flat Edge and Face Coloring
  - Coloring Edges with Shared Vertices
- How MATLAB Interprets Patch Color Data
  - Indexed Color Data
  - Truecolor Patches
  - Interpolating in Indexed Color vs. Truecolor

#### Day 13 – Bit-mapped images

##### **Displaying Bit-Mapped Images**

- Images in MATLAB
  - Bit Depth Support
  - Data Types
- Image Types
  - Indexed Images
  - Intensity Images
  - RGB (Truecolor) Images
- Working with 8-Bit and 16-Bit Images
  - 8-Bit and 16-Bit Indexed Images
  - 8-Bit and 16-Bit Intensity Images
  - 8-Bit and 16-Bit RGB Images
  - Mathematical Operations Support for uint8 and uint16
  - Other 8-Bit and 16-Bit Array Support
  - Summary of Image Types and Numeric Classes
- Reading, Writing, and Querying Graphics Image Files
  - Reading a Graphics Image
  - Writing a Graphics Image
  - Obtaining Information About Graphics Files
- Displaying Graphics Images
  - Summary of Image Types and Display Methods

- Controlling Aspect Ratio and Display Size
- The Image Object and Its Properties
  - CData
  - CDataMapping
  - XData and YData
  - EraseMode
- Printing Images
- Converting the Data or Graphic Type of Images

#### Day 14 – Printing graphs

#### **Printing MATLAB Graphics**

- Printing from the Menu
  - PC
  - UNIX
  - Adjusting the Size and Color of the Graphic
  - Print Preview
  - Exporting Figures to Graphic Files
- Printing from the Command Line
  - The print Command
  - Passing String Arguments to print
  - Changing Default Print Settings
- Graphic File Formats
  - Output Formats Created by Ghostscript
- Specifying Command Line Options
  - Tiff Preview for EPS (-tiff)
  - Specifying the Bounding Box (-loose)
  - CMYK Color Separations (-cmyk)
  - Appending to an Existing File (-append)
  - Specifying Resolution (-r)
  - Default Character-Set Encoding (-adobecset)
  - Specifying the Figure or Model to Print (-f, -s)
  - Specifying the Printer to Use (-P) UNIX only
- Selecting an Output Format
  - PostScript
  - HPGL Compatible Plotters (-dhpgl)
  - Adobe Illustrator 88 (-dill)
- PC-Specific Output Options
  - Printing Lines and Text in Color or Black and White
- Specifying Fonts and Character Sets
  - PC
  - UNIX
- Specifying Line Styles
  - Windows 95 Limitation
- Selecting the Rendering Method for Printing

- Specifying the Rendering Method
- Size of Output Files
- Changing Background Colors
- Troubleshooting MS-Windows Printing
- Saving MATLAB Graphics in File Format
  - MS-Windows Copy Options
- Importing MATLAB Graphics into Other Applications
  - Selecting the Graphics File Format
    - Vector Format
    - Bitmap Format
  - Additional Considerations
  - Application-Specific Issues
- Including Graphics in Word Processor Documents
  - Example - Importing a Graph
  - Example - Importing a Bitmap Graphic
- Setting Figure Printing Properties
  - Positioning the Figure on the Printed Page
    - Example - Readjusting PaperPosition
  - Specifying Paper Orientation
  - Specifying Paper Size
  - Reversing Figure Colors

## Day 15 - Handle graphics

### **Handle Graphics**

- Graphics Objects
- Object Properties
- Graphics Object Creation Functions
  - Example - Creating Graphics Objects
  - Parenting
  - High-Level Vs. Low-Level
  - Simplified Calling Syntax
- Setting and Querying Property Values
  - Setting Property Values
  - Querying Property Values
  - Factory-Defined Property Values
- Setting Default Property Values
  - Defining Default Values
  - Examples - Setting Default LineStyles
- Accessing Object Handles
  - The Current Figure, Axes, and Object
  - Searching for Objects by Property Values -- findobj
  - Copying Objects
  - Deleting Objects
- Controlling Graphics Output

- Specifying the Target for Graphics Output
- Preparing Figures and Axes for Graphics
- Targeting Graphics Output with newplot
- Example - Using newplot
- Testing for Hold State
- Protecting Figures and Axes
- The Close Request Function
- Handle Validity versus Handle Visibility
- Saving Handles in M-files
- Properties Changed by Built-In Functions

#### Day 16 - Figure properties

##### **Figure Properties**

- Positioning Figures
  - Example -- Specifying Figure Position
- Controlling How MATLAB Uses Color
  - Indexed Color Displays
  - Colormap Colors and Fixed Colors
  - Using a Large Number of Colors
  - Nonactive Figures and Shared Colors
  - Dithering Truecolor on Indexed Color Systems
- Selecting Drawing Methods
  - Backing Store
  - Double Buffering
  - Selecting a Renderer
- Specifying the Figure Pointer
  - Defining Custom Pointers
- Interactive Graphics

#### Day 17 - Axes properties

##### **Axes Properties**

- Labeling and Appearance Properties
- Positioning Axes
  - Units
- Multiple Axes per Figure
  - Placing Text Outside the Axes
  - Multiple Axes for Different Scaling
- Individual Axis Control
  - Setting Axis Limits
  - Setting Tick Mark Locations
  - Changing Axis Direction
- Using Multiple X and Y Axes
- Automatic-Mode Properties
- Colors Controlled By Axes

Specifying Axes Colors  
Axes Color Limits - The CLim Property  
Example - Simulating Multiple Colormaps In a Figure  
Defining the Color of Lines for Plotting  
Line Styles Used for Plotting - LineStyleOrder  
Plotting and Visualization Functions
